Home Healers — GTM Specialist Brief

Container ID: `GTM-TDDDW3G3`
Website: https://home-healers.com (AR default, EN under `/en`)
Implementation: Custom `dataLayer.push()` events from the Next.js site
Last updated: 2026-10-31

Dev verification (2026-10-31): Local smoke test confirmed these events push correctly on click: `ui_click`, `whatsapp_click`, `download_app_click`, `offer_book_click`, `live_chat_click`, `phone_click`, `blog_click`, `booking_click`.

Deploy note: These tracking changes must be deployed to production before GTM Preview on the live site will see them.

1. How the website sends events

The site pushes Custom Events into `window.dataLayer`.

Example payload:

```
window.dataLayer.push({
  event: "whatsapp_click",
  click_text: "WhatsApp",
  click_url: "https://api.whatsapp.com/send?phone=966...",
  click_path: "/",
  click_location: "floating_contact",
  click_tag: "a",
  page_path: "/",
  page_url: "https://home-healers.com/"
});
```

Important: Every interactive click fires **two** events:

1. `ui_click` — catch-all (includes `action_event` = the specific name)
2. The **specific** event (e.g. `whatsapp_click`, `booking_click`)

Use specific events for conversions/ads. Use `ui_click` for exploration / debugging.

2. Full event catalog

Catch-all

Event name	When it fires
`ui_click`	Any button, link, role=button, submit/reset input
`form_submit`	Any HTML form submit
`cta_click`	Interactive click that did not match a more specific rule

Contact / engagement

Event name	When it fires
`whatsapp_click`	WhatsApp links / WhatsApp CTAs
`phone_click`	`tel:` links
`email_click`	`mailto:` links
`live_chat_click`	Floating live chat button
`social_click`	Facebook, Instagram, X, LinkedIn, YouTube, TikTok, Snapchat

Event name	When it fires
`download_app_click`	App Store / Google Play
`language_switch`	User switches AR ↔ EN
`language_menu_toggle`	Opens language dropdown
`mobile_menu_open` / `mobile_menu_close`	Mobile burger menu

Navigation / content

Event name	When it fires
`nav_click`	Header menu links (Home, About, Specialties, Offers, Blog, Contact) + home/terms/privacy
`blog_click`	Blog article open
`category_click`	Categories / specialties links
`about_click`	About page links
`contact_click`	Contact page links
`offer_click`	Offer listing / offer details
`offer_book_click`	Offer "Book now"
`booking_click`	Links to `/booking` (Book consultation)
`doctor_apply_click`	Links to `/doctors-apply`

Conversions (high priority)

Event name	When it fires	Extra params
`reservation_created`	Reservation successfully created (booking flow OR offer checkout)	`reservation_id`, `source` (`booking_flow` | `offer_booking`), optional `offer_id`, `package_id`, `doctor_id`
`reservation_payment`	User starts cash or Telr payment	`reservation_id`, `payment_method` (`cash` | `telr`), `source`
`contact_form_submit`	Contact page form submit	`click_location`
`blog_lead_submit`	Blog lead form success	`service`, `blog_title`
`doctor_apply_submit`	Doctor registration submitted successfully	`doctor_role`
`landing_form_submit`	Landing page form submit	`submit_channel` (`whatsapp` | `api`)
`doctor_profile_click`	About page doctor card open	`click_location`
`go_home_click`	Go home after payment / confirmation	`click_location`
`receipt_download`	Download booking receipt PDF	`click_location`
`invoice_download`	Download invoice PDF	`click_location`
`payment_retry`	Retry payment (failed / canceled pages)	`click_location`
`review_submit`	Reservation review submitted	`reservation_id`
`offer_book_confirm`	Confirm offer booking (before payment)	`click_location`, offer label

3. Data Layer variables to create in GTM

Create **Data Layer Variables** (Variable type = Data Layer Variable):

GTM Variable Name	Data Layer Variable Name
DLV - click_text	`click_text`
DLV - click_url	`click_url`
DLV - click_path	`click_path`
DLV - click_location	`click_location`
DLV - click_tag	`click_tag`
DLV - page_path	`page_path`
DLV - page_url	`page_url`
DLV - action_event	`action_event`
DLV - reservation_id	`reservation_id`
DLV - payment_method	`payment_method`
DLV - source	`source`
DLV - offer_id	`offer_id`
DLV - offer_name	`offer_name`
DLV - from_locale	`from_locale`
DLV - to_locale	`to_locale`
DLV - submit_channel	`submit_channel`

4. Triggers to create (Custom Event)

For each event you need, create:

- **Trigger type:** Custom Event
- **Event name:** exact string from catalog (case-sensitive)
- **This trigger fires on:** All Custom Events

Recommended minimum set

Trigger name	Event name
CE - ui_click	`ui_click`
CE - whatsapp_click	`whatsapp_click`
CE - phone_click	`phone_click`
CE - download_app_click	`download_app_click`
CE - booking_click	`booking_click`
CE - doctor_apply_click	`doctor_apply_click`
CE - blog_click	`blog_click`
CE - offer_click	`offer_click`
CE - offer_book_click	`offer_book_click`
CE - reservation_created	`reservation_created`
CE - reservation_payment	`reservation_payment`
CE - contact_form_submit	`contact_form_submit`
CE - blog_lead_submit	`blog_lead_submit`

Trigger name	Event name
CE - doctor_apply_submit	`doctor_apply_submit`
CE - landing_form_submit	`landing_form_submit`
CE - live_chat_click	`live_chat_click`

5. Recommended GA4 Event tags

Assume a GA4 Configuration tag already exists for the property.

For each important Custom Event trigger, create a **GA4 Event** tag:

Tag name	Event Name (GA4)	Trigger
GA4 - WhatsApp Click	`whatsapp_click`	CE - whatsapp_click
GA4 - Phone Click	`phone_click`	CE - phone_click
GA4 - Download App	`download_app_click`	CE - download_app_click
GA4 - Booking Click	`booking_click`	CE - booking_click
GA4 - Doctor Apply Click	`doctor_apply_click`	CE - doctor_apply_click
GA4 - Blog Click	`blog_click`	CE - blog_click
GA4 - Offer Book Click	`offer_book_click`	CE - offer_book_click
GA4 - Reservation Created	`reservation_created`	CE - reservation_created
GA4 - Reservation Payment	`reservation_payment`	CE - reservation_payment
GA4 - Contact Form Submit	`contact_form_submit`	CE - contact_form_submit
GA4 - Doctor Apply Submit	`doctor_apply_submit`	CE - doctor_apply_submit
GA4 - Landing Form Submit	`landing_form_submit`	CE - landing_form_submit
GA4 - UI Click (optional)	`ui_click`	CE - ui_click

Event parameters to pass

- `click_text` → `{{DLV - click_text}}`
- `click_url` → `{{DLV - click_url}}`
- `click_location` → `{{DLV - click_location}}`
- `page_path` → `{{DLV - page_path}}`
- `reservation_id` → `{{DLV - reservation_id}}`
- `payment_method` → `{{DLV - payment_method}}`
- `source` → `{{DLV - source}}`
- `offer_id` → `{{DLV - offer_id}}`

6. Suggested conversions / ads mapping

Business goal	GTM / GA4 event	Notes
Lead via WhatsApp	`whatsapp_click`	Soft conversion
Started booking	`booking_click` or `offer_book_click`	Soft
Reservation created	`reservation_created`	Strong conversion
Payment started	`reservation_payment`	Strong (filter `payment_method`)
Doctor registration	`doctor_apply_submit`	Strong

Business goal	GTM / GA4 event	Notes
Contact lead	`contact_form_submit` / `landing_form_submit` / `blog_lead_submit`	Lead

For Google Ads / Meta, prefer `reservation_created`, `reservation_payment`, `doctor_apply_submit`, and `whatsapp_click`.

7. QA checklist (Preview mode)

1. Open GTM → **Preview** → enter `https://home-healers.com`
2. Confirm container `GTM-TDDDW3G3` is connected
3. Click each action and verify the Custom Event appears in the left summary:

Action	Expected event(s)
Floating WhatsApp	`ui_click` + `whatsapp_click`
Floating Phone	`ui_click` + `phone_click`
Floating Live chat	`ui_click` + `live_chat_click`
Header "Book consultation"	`ui_click` + `booking_click`
Header "Doctor registration"	`ui_click` + `doctor_apply_click`
Header nav Blog	`ui_click` + `nav_click` (or `blog_click` if path is `/blog`)
Open a blog card	`ui_click` + `blog_click`
Offer "Book now"	`ui_click` + `offer_book_click`
Footer Google Play / App Store	`ui_click` + `download_app_click`
Language switch EN/AR	`language_switch` (+ `ui_click` from button)
Complete booking → create reservation	`reservation_created`
Pay cash / Telr	`reservation_payment`
Submit contact form	`form_submit` + `contact_form_submit`
Submit doctors-apply form	`doctor_apply_submit`

4. In the event detail, confirm Data Layer variables are populated.
5. Confirm GA4 Event tags fire (Tags Fired).
6. Publish container after QA.

Browser console check (production)

```
// After a click:
window.dataLayer.filter(e => e.event).slice(-5)
```

You should see recent objects with `event: "ui_click"` and named events.

8. Technical notes for the specialist

1. **GTM container is already installed** in the Next.js app (`AnalyticsScripts`), ID `GTM-TDDDW3G3`. Do **not** add a second GTM snippet.
2. GTM script loads on first user interaction or after ~3.5s (performance). Early `dataLayer.push` calls are queued and processed when GTM loads.
3. Locales: Arabic is unprefixed (`/booking`), English is `/en/booking`. The site strips locale before classifying path-based events.
4. Do **not** rely on Click triggers / CSS selectors for these actions — use **Custom Event** triggers only.
5. Conversion events (`reservation_created`, `reservation_payment`, form submits) are pushed from app logic, not only from clicks.
6. Microsoft Clarity (`wc9sy4cx56`) is also loaded from the same analytics component; keep it separate from GTM tags unless requested.

9. Priority setup order

1. Create DLVs (section 3)
2. Create Custom Event triggers for conversions + WhatsApp + booking + download app
3. Create GA4 Event tags
4. Mark GA4 conversions: `reservation_created`, `reservation_payment`, `whatsapp_click`, `doctor_apply_submit`
5. QA in Preview
6. Publish
7. Optionally add remaining engagement events (`blog_click`, `nav_click`, `ui_click`)

10. Contact for engineering questions

Website implementation files:

- `src/lib/gtm.ts` — event names + `trackEvent()`
- `src/components/GtmClickTracker.tsx` — global click/submit listener
- `src/components/AnalyticsScripts.tsx` — GTM container loader

If a new CTA needs a custom name, engineering can add:

```
data-gtm-event="my_event_name"
data-gtm-location="hero"
data-gtm-label="Book now"
```
